

# Curricular development focusing on competences and learning outcomes

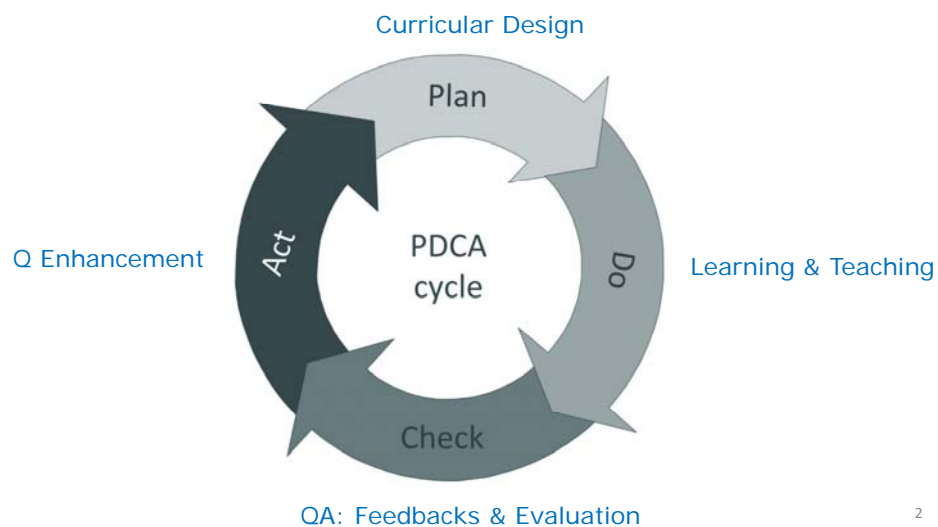

**Huaan Fan**

KTH, Stockholm, Sweden

University of Leon, Spain. 2018-02-19

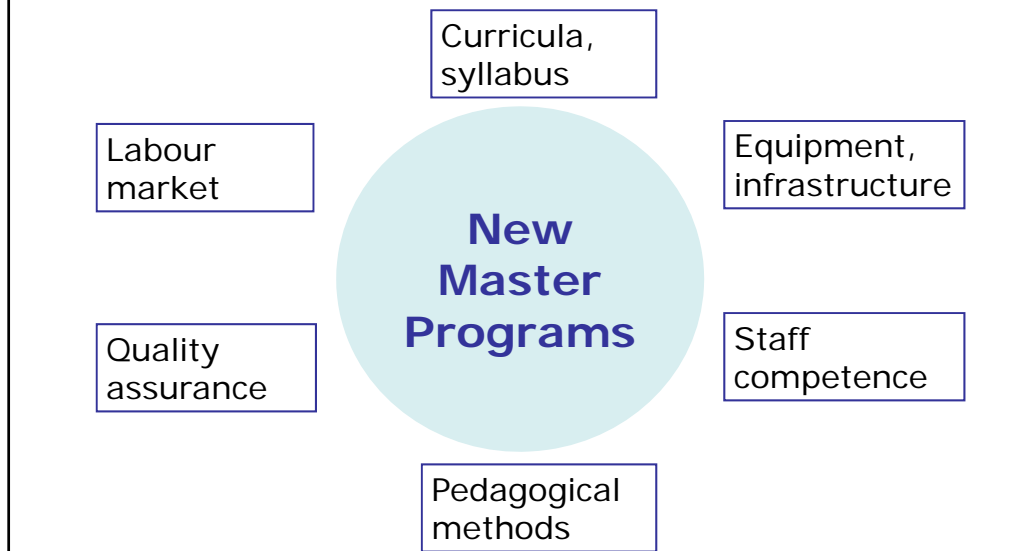

## PDCA cycle of higher education

---

## GEO4D: objectives & activities

---

## Guidelines for higher education

---

- Education should serve the society in general and the labour market in particular
- Education must be updated to reflect changes in the society, in science & technology, and in expectations of new generation of students
- Education should provide students with professional competences for their future employment and personal development
- Education is meant for students and thus should be student-centered

## Student-centered, active learning

---

- Teacher-centered teaching emphasizes the interests and expertise of teachers, while student-centered learning focuses on students's need of professional competences
- To facilitate more effective learning, we have to change philosophy: from **teaching by teachers** to **active learning by students**

## What is competence ?

---

- A combination of knowledge, understanding, skills, capability and attitude that enables an individual to perform certain *professional* tasks
- Competences deals with "what is expected in a *professional* workplace."
- Emphasis on **performing an actual job**, not gaining knowledge/skills for their own sake or as a hobby.

## Competences

---

- Basic parameters to compare education
- A reference of transparency for students/stakeholders
- A tool for better communication with employers and stakeholders - employability
- Benchmark for quality assurance & accreditation
- Students obtain competences through different learning activities, e.g. a series of courses (modules)

## Course description: syllabus

---

- **Aims/objectives** of a course
  - A statement of what topics the course will cover or what the teacher wants to teach
  - *Teacher-centered, process-centered*
- **Learning outcomes** of a course
  - A statement of what students will know, understand and be able to do after the course
  - *Student-centered, output-centered*

## Competences vs Learning Outcomes

---

- Competences concern a study programme, while LOs address individual courses (modules, subjects)
- Desired competences are defined on the basis of input from internal and external stakeholders (e.g. employers)
- LOs are statements of what a student is expected to know, understand and be able to do after completion of a course
- LOs are mostly formulated by the teaching staff, taking into account the programme's desired competences

## Competences and Learning Outcomes

---

- Learning/teaching activities help students to learn
- Assessment activities make sure that students have achieved the stated **Learning Outcomes**
- **Learning Outcomes** lead to skills/**Competences**
- **Competences** make graduates employable and useful for the society

## Competences of a study programme

---

(LOs at programme level)

- Knowledge and understanding of the subject
- Practical skills
- Intellectual skills, higher level thinking skills
- Generic (transversal/transferable) skills

## Competences for MSc in *Geodesy and Geoinformatics*

---

- 1) Broad knowledge in land survey, mapping and GIS
- 2) specialised knowledge in certain areas and current research topics
- 3) Practical skills to do measurements, process field data and evaluate the results
- 4) Practical skills to structure, visualize and analyze spatial data using GIS software
- 5) Ability to choose proper methods for specific conditions and requirements
- 6) Skills to evaluate possibilities and limitations of existing methods
- 7) Insight on the needs of new technologies/solutions in geodesy/geoinformatics
- 8) Be able to communicate effectively and present scientific work in oral/written form
- 9) Project management skills and ability to work in group and in [project form](#)
- 10) Insight on ethical, environmental and sustainable development issues and their relevance in professional work

## MSc in *Geodesy and Geoinformatics*

|     |  |        |
|-----|--|--------|
| 1)  | Adjustment theory                          | (7,5c) |
| 2)  | Map projections & reference systems        | (7,5c) |
| 3)  | Global Navigation Satellite Systems (GNSS) | (7,5c) |
| 4)  | Physical geodesy                           | (7,5c) |
| 5)  | Laser scanning technologies                | (7,5c) |
| 6)  | Integrated navigation                      | (7,5c) |
| 7)  | Spatial databases                          | (7,5c) |
| 8)  | Geovisualization                           | (7,5c) |
| 9)  | GIS architecture                           | (7,5c) |
| 10) | Spatial analysis                           | (7,5c) |
| 11) | Remote sensing and image processing        | (7,5c) |
| 12) | GIS project                                | (7,5c) |
| 13) | MSc thesis project                         | (30c)  |

## The Competence Matrix for *Geodesy and Geoinformatics*

| COMPETENCES  | COURSES | 01. Adjustment theory | 02. Map projections & RS | 03. GNSS | 04. Physical geodesy | 05. Laser scanning | 06. Engineering geodesy | 07. Spatial databases | 08. Geovisualization | 09. GIS architecture | 10. Spatial analysis | 11. Image processing | 12. GIS project |
|--|---------|-----------------------|--------------------------|----------|----------------------|--------------------|-------------------------|-----------------------|----------------------|----------------------|----------------------|----------------------|-----------------|
| broad knowledge in land survey, mapping and GIS                                      | X       | X                     | X                        | X        | X                    | X                  | X                       | X                     | X                    | X                    | X                    | X                    | X               |
| specialized knowledge in some areas and current research topics                      | X       | X                     | X                        | X        | X                    | X                  | X                       | X                     | X                    | X                    | X                    | X                    | X               |
| practical skills to carry out measurements, process field data and evaluate results  | X       | X                     | X                        |          | X                    | X                  |                         |                       |                      |                      |                      |                      |                 |
| practical skills to structure, visualize and analyse spatial data using GIS          |         |                       |                          |          | X                    | x                  | X                       | X                     | X                    | X                    | X                    | X                    | X               |
| ability to choose proper methods for specific conditions and requirements            |         | X                     | X                        |          | X                    | X                  |                         | X                     |                      | X                    |                      |                      | X               |
| ability to evaluate possibilities and limitations of existing geodetic methods       |         | X                     | X                        |          | X                    | X                  |                         |                       |                      |                      |                      |                      | X               |
| insight on needs of new technologies and new solutions in geodesy and geoinformatics |         |                       | X                        | X        | X                    | X                  | X                       | X                     | X                    | X                    | X                    | X                    | X               |
| skills to communicate effectively  |         |                       |                          |          | X                    | X                  |                         |                       |                      | X                    | X                    |                      | X               |
| ability to manage project and work in groups & project form                          |         |                       |                          |          | X                    | X                  |                         |                       |                      | X                    |                      |                      | X               |
| awareness on ethical issues as well as climate change + sustainable development      |         |                       |                          | X        | X                    | X                  | X                       |                       |                      | X                    |                      |                      | X               |

## 585718-EPP-2017-HU DSinGIS

| Competences from doctoral studies in Geoinformation Sciences |  |
|--|--|
|  | <b>Professional competences in GIScience</b>   |
| 1  | Advanced skills in analyzing, integrating and managing spatial data  |
| 2  | Skills to design GIS systems and services  |
| 3  | Ability for innovations in designing, managing and implementing GIS projects   |
| 4  | Ability to solve complex spatial problems in global context  |
| 5  | Knowledge and skills to address challenges in defining and maintaining geodetic reference systems                            |
| 6  | Ability to investigate limitations and possibilities of GNSS for high accuracy positioning and navigation                    |
| 7  | Deep insight on earth's gravity field and the geoid and their applications in geodesy and earth sciences                     |
| 8  | Skills to initiate geographic/land/cadastral etc. information systems  |
|  | <b>Research competences</b>  |
| 9  | Insight on current research activities in GI Sciences  |
| 10   | Ability to critically evaluate existing theories and technologies and identify the needs of further research for improvement |
| 11   | Ability to design scientific experiments, interpret experiment results and seek solutions based on sound scientific methods  |
| 12   | Ability to apply multi-disciplinary approaches to solve scientific problems  |
|  | <b>Generic competences (soft skills)</b>   |
| 13   | Ability to communicate effectively in oral or written form, to both specialist and non-specialist audiences                  |
| 14   | Ability to choose and use right social media for publishing and communicating  |
| 15   | Leadership skills and ability to work in project team and in multi-disciplinary environment                                  |
| 16   | Innovation and entrepreneurial skills to widely use research results and innovation ideas                                    |
| 17   | Ability to engage in life-long learning  |
| 18   | Awareness of ethic, economic and professional issues, as well as sustainable development issues                              |

## Learning outcomes

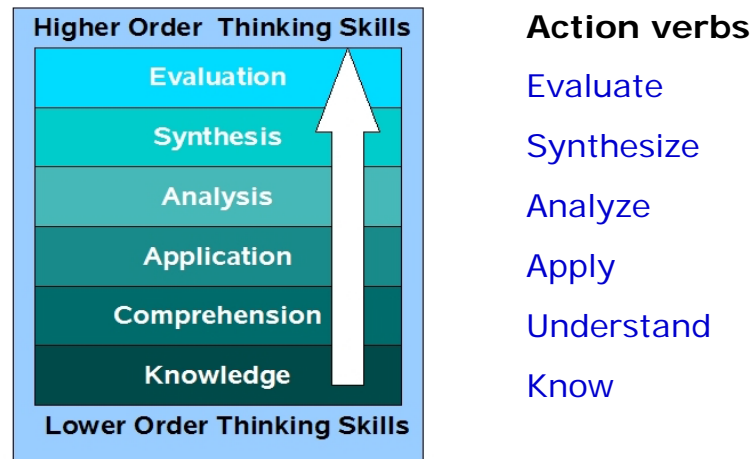

---

- In a learning process, learning/teaching activities (lessons) are input, while LOs are the expected outputs.
- LO are not a repeat of titles of lessons in a course, rather **what student should know, understand, be able to do** after the lessons.
- It should be possible to assess if a student has achieved the stated LOs or not.
- LOs can be formulated using active verbs, from Bloom's taxonomy

## Bloom's Taxonomy (1956)

---

## Bloom's Taxonomy (1/2)

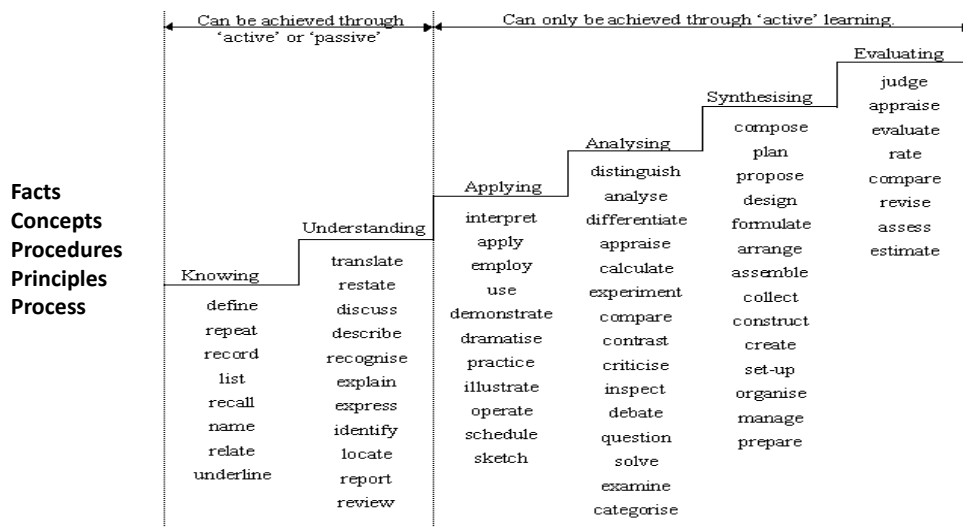

---

- 1. Knowledge** (*recalling important information*) – e.g. define, repeat, record, list, recall, name, relate, underline.
- 2. Comprehension** (*explaining important information*) – e.g. discuss, describe, recognize, explain, identify, locate, report, review, tell
- 3. Application** (*solving close ended problems where there is a clear answer*) – e.g. interpret, apply, employ, use, demonstrate, dramatize, practice, illustrate, operate, schedule, sketch.

## Bloom's Taxonomy (2/2)

4. **Analysis** (*solving open problems where there is no single clear answer*) – e.g. distinguish, analyse, differentiate, appraise, calculate, experiment, test, compare, contrast, criticize, diagram, inspect, debate, question, relate, solve, examine, categorize
5. **Synthesis** (*creating unique answers to open problems*) – e.g. compose, plan, propose, design, formulate, arrange, assemble, collect, construct, create, set up, organize, manage, prepare.
6. **Evaluation** (*making critical judgements based on sound knowledge base*) – e.g. judge, appraise, evaluate, rate, compare, revise, assess, *estimate*

## Bloom's taxonomy

# Bloom's Taxonomy (revised)

Higher order thinking skills

**Create**  
**Evaluate**  
**Analyze**  
**Apply**  
**Understand**  
**Know**

Lower order thinking skills

# Syllabus of one course

|                                     |   |
|-------------------------------------|---|
| <b>Course code</b>                  | AH2922  |
| <b>Course name</b>                  | Map projections and reference systems   |
| <b>Semester / year</b>              | 1 / 1   |
| <b>ECTS credits</b>                 | 7,5c  |
| <b>Language of instructions</b>     | Swedish or English  |
| <b>Study hours</b>                  | Lecture: 28 hours<br>Exercise: 36 hours<br>Project: 24 hours<br>Self-study: 112 hours<br>Total: 200 hours (27 hours per ECTS credit)  |
| <b>Learning outcomes</b>            | After completion of this course, students should be able to<br>1) describe the geometry of the reference ellipsoid<br>2) compute geodesic lines on the reference ellipsoid<br>3) analyze, compare and select map projections for different applications<br>4) calculate projection coordinates for commonly used map projections<br>5) understand how astronomic networks, height systems and modern 3D reference systems are constructed<br>6) understand astro-geodynamic phenomena and their influences on celestial and terrestrial reference systems<br>7) transform coordinates between different reference systems.  |
| <b>Syllabus (contents, lessons)</b> | List of lectures (2h each):<br>1. Geometry of the earth sphere and earth ellipsoid<br>2. Coordinate systems on the ellipsoid<br>3. Geodesic lines and basic geodesic problems<br>4. Classification of map projections. General projection theory.<br>5. Azimuthal projections. Conical projections<br>6. Cylindrical projections. Gauss-Kruger projections. UTM.<br>7. Spherical astronomy<br>8. Astro-geodesic triangulation. Geodesic datums.<br>9. Gravity, geoid and height systems<br>10. Geodynamice plate tectonics, land uplift, earth tide, sea level change<br>11. Earth rotation: polar motion, precession and nutation. Earth orientation parameters (EOP).<br>12. Celestial vs. terrestrial reference systems (ICRS, ITRS)<br>13. Existing reference frames: ITRF 2005, WGS 84, EUREF 89, SWEREF 99, RT 90, RH 70, SWEN90BLR.<br>14. Transformation between 3D coordinate systems. Estimation of 3D Helmert transformation parameters. |

## Tasks of curricular workshop in Leon

---

- Define the competences of a new MSc program
- Design a list of courses (modules) in the program
- Specify LOs and lessons for each course  
(using a standard template)
- Create a competence matrix (CM).  
Make sure that no row of CM is empty
